第十一章 概率在数据科学的应用

张子威

2025年12月19日

- ① 数据与关联规则挖掘
- ② 贝叶斯分类
- ③ 从相关性到因果性

分类任务

➤ 分类是最常见的一类机器学习/人工智能任务

- 例子：鸟类图片分类
- 任务：给定一张图片，输出它的类别
- 模型： $F(\text{image}) \rightarrow \text{类别的概率分布}$
- 训练数据：图片以及它们对应的标签

- 训练：根据训练数据，优化模型
- 测试：评估模型的准确性

分类任务

➤ 分类是最常见的一类机器学习/人工智能任务

- 例子：垃圾邮件分类
- 任务：给定一封邮件，判定它是否为垃圾邮件
- 模型： $F(\text{✉}) \rightarrow$ 垃圾邮件概率
- 训练数据：历史邮件内容以及它们对应的标签

Dear Sir.

First, I must solicit your confidence in this transaction, this is by virtue of its nature as being utterly confidential and top secret. ...

TO BE REMOVED FROM FUTURE MAILINGS, SIMPLY REPLY TO THIS MESSAGE AND PUT "REMOVE" IN THE SUBJECT.

99 MILLION EMAIL ADDRESSES FOR ONLY \$99

Ok, I know this is blatantly OT but I'm beginning to go insane. Had an old Dell Dimension XPS sitting in the corner and decided to put it to use, I know it was working pre being stuck in the corner, but when I plugged it in, hit the power nothing happened.

- 训练：根据训练数据，优化模型
- 测试：评估模型的准确性

垃圾邮件分类问题

- 输入: $x = [x_1, x_2, \dots, x_n]$, x_i 是邮件中第 i 个词
- 输出: $y = 1$ (垃圾邮件) 或 $y = 0$ (非垃圾邮件)
- 问题分析: 邮件主题很大程度上决定了邮件内容
 - 垃圾邮件: 免费, 推销, " \$" 符号, 等等
- 将其建模为一个生成式模型:

$$P(y, x_1, x_2, \dots, x_n)$$

在本例中, 其与判别模型有很大联系:

$$P(y|x_1, x_2, \dots, x_n) = \frac{P(y, x_1, x_2, \dots, x_n)}{P(x_1, x_2, \dots, x_n)}$$

垃圾邮件分类问题

➤ 朴素贝叶斯(Naïve Bayes)+词袋模型(Bag of Words)

➤ 假定单词之间互不影响，词语位置也不影响

➤ 但是否为垃圾邮件会影响用词

$$\begin{aligned} P(y, x_1, x_2, \dots, x_n) &= P(y)P(x_1, x_2, \dots, x_n|y) \\ &= P(y) \prod_i P(x_i|y) \end{aligned}$$

➤ $P(y)$: 是否为垃圾邮件的先验概率

➤ $P(x_i|y)$: 垃圾邮件与非垃圾邮件的用词区别

• 如何估算？从训练集中统计！

$P(x_i y = 0)$	the	paper	you	submit	is	accepted	...
	0.0156	0.0153	0.0115	0.0095	0.0093	0.0086	
$P(x_i y = 1)$	the	money	of	your	deposit	from	...
	0.0210	0.0133	0.0069	0.0250	0.0385	0.0082	

垃圾邮件分类问题

➤ 推断举例：Gray would you like to lose weight while you sleep

单词	$P(x_i y = 1)$	$P(x_i y = 0)$	$\log P(y = 1, \dots, x_i)$	$\log P(y = 0, \dots, x_i)$
(先验)	0.33333	0.66666	-1.1	-0.4

➤ 分类概率：

$$P(y = 1|x) = \frac{P(y = 1, x)}{P(x)} = \frac{P(y = 1, x)}{P(y = 1, x) + P(y = 0, x)} = \frac{e^{-76.0}}{e^{-76.0} + e^{-80.3}} = 98.7\%$$

过拟合与拉普拉斯平滑

- 由于训练样本局限，存在一些 $P(x|y) = 0$ 的情况
- 例：邮件分类（ $y = 1$ 为垃圾邮件， $y = 0$ 为正常邮件）
 - 部分词语相对概率

$$\frac{P(x|y=1)}{P(x|y=0)}$$

south-west	:	∞
nation	:	∞
morally	:	∞
nicely	:	∞
extent	:	∞
seriously	:	∞
...		

$$\frac{P(x|y=0)}{P(x|y=1)}$$

screens	:	∞
minute	:	∞
guaranteed	:	∞
\$205.00	:	∞
delivery	:	∞
signature	:	∞
...		

过拟合与拉普拉斯平滑

- 原因：条件概率估算**过于依赖训练数据**
 - 不是出现 “minute” “\$205” 的均是垃圾邮件
 - 同理，不是出现 “south-west” 的均是正常邮件
 - 甚至，如果训练集没有出现过的词
- 称为**过拟合 (overfitting) 现象**
 - 定义：模型过于紧密或精确地匹配训练数据集，以致于无法良好地拟合其他数据或预测未来的观察结果
 - 例：

过拟合与拉普拉斯平滑

- 之前采用的是**最大似然估计**(Maximum Likelihood Estimate)

$$P_{MLE}(x) = \frac{\text{包含}x\text{的样本数}}{\text{总样本数}}$$

- 最大似然估计的潜在问题：以掷硬币为例(不一定均匀)
 - 如果仅掷硬币1次为正面，你觉得 $P(\text{正面})$ 是多少？
 - 若掷硬币10次，8次为正面，你觉得 $P(\text{正面})$ 是多少
 - 若掷硬币10万次，8万次为正面，你觉得 $P(\text{正面})$ 是多少
- 解决思想：参数的**贝叶斯估计** (Bayesian estimation)
 - 许多问题中，我们有对于参数的先验（例如硬币正面的概率）
 - 通过实验，不断修正对于先验的认知
 - 结果不充分时，主要依赖先验；随实验增多，愈加相信数据

过拟合与拉普拉斯平滑

➤ 拉普拉斯平滑

➤ 假设每个可能得取值已经出现过 k 次

$$P_{LAP,k}(x) = \frac{c(x)+k}{N+k|X|}$$

➤ 例子：假设投掷硬币三次的结果：

➤ $P_{MLE}(x) = P_{LAP,0} = \langle \frac{2}{3}, \frac{1}{3} \rangle$

$$P_{LAP,1} = \langle \frac{3}{5}, \frac{2}{5} \rangle$$

$$P_{LAP,100} = \langle \frac{102}{203}, \frac{101}{203} \rangle$$

k 值越大，先验越强

➤ 拉普拉斯平滑应用于条件概率估算：

$$P_{LAP,k}(x|y) = \frac{c(x,y) + k}{c(y) + k|X|}$$

过拟合与拉普拉斯平滑

➤ 拉普拉斯平滑后的概率

($y = 1$ 为垃圾邮件, $y = 0$ 为正常邮件)

$$\frac{P(x|y=1)}{P(x|y=0)}$$

south-west	:	10.3
nation	:	9.5
morally	:	7.8
nicely	:	5.7
extent	:	4.6
seriously	:	3.1
...		

$$\frac{P(x|y=0)}{P(x|y=1)}$$

screens	:	28.8
minute	:	27.3
guaranteed	:	25.2
\$205.00	:	20.3
delivery	:	18.2
signature	:	17.5
...		

购买预测问题

➤ 根据用户资料，判断其购买电脑的概率

➤ 训练数据：

Age	Income	Student	Credit_rating	Buys_computer
<=30	high	no	fair	no
<=30	high	no	excellent	no
30...40	high	no	fair	yes
>40	medium	no	fair	yes
>40	low	yes	fair	yes
>40	low	yes	excellent	no
31...40	low	yes	excellent	yes
<=30	medium	no	fair	no
<=30	low	yes	fair	yes
>40	medium	yes	fair	yes
<=30	medium	yes	excellent	yes
31...40	medium	no	excellent	yes
31...40	high	yes	fair	yes
>40	medium	no	excellent	no

➤ 目标：预测样本购买电脑的概率

$X = (\text{age} \leq 30, \text{Income} = \text{medium}, \text{Student} = \text{yes}, \text{Credit_rating} = \text{Fair})$

购买预测问题

➤问题转化:

$$P(\text{buys}=\text{"yes"}|X)=\frac{P(\text{buys}=\text{"yes"},X)}{P(X)}=\frac{P(\text{buys}=\text{"yes"},X)}{P(\text{buys}=\text{"yes"},X)+P(\text{buys}=\text{"no"},X)}$$

$$\begin{aligned}P(\text{buys}=\text{"yes"}, X)&=P(\text{buys}=\text{"yes"})*P(X|\text{buys}=\text{"yes"})\\&=P(\text{buys}=\text{"yes"})*\prod_i P(X_i|\text{buys}=\text{"yes"})\\&=P(\text{buys}=\text{"yes"})*P(\text{Age}|\text{buys}=\text{"yes"})*P(\text{Income}|\text{buys}=\text{"yes"})\\&\quad *P(\text{Student}|\text{buys}=\text{"yes"})*P(\text{Credit}|\text{buys}=\text{"yes"})\end{aligned}$$

$$\begin{aligned}P(\text{buys}=\text{"no"}, X)&=P(\text{buys}=\text{"no"})*P(X|\text{buys}=\text{"no"})\\&=P(\text{buys}=\text{"no"})\prod_i P(X_i|\text{buys}=\text{"no"})\\&=P(\text{buys}=\text{"no"})*P(\text{Age}|\text{buys}=\text{"no"})*P(\text{Income}|\text{buys}=\text{"no"})\\&\quad *P(\text{Student}|\text{buys}=\text{"no"})*P(\text{Credit}|\text{buys}=\text{"no"})\end{aligned}$$

购买预测问题

$X = (\text{age} \leq 30, \text{Income} = \text{medium}, \text{Student} = \text{yes}, \text{Credit_rating} = \text{Fair})$

➤ 为具体计算，首先统计两类各个特征的条件概率

$$P(\text{age} = "<30" \mid \text{buys} = \text{"yes"}) = 2/9 = 0.222$$

$$P(\text{age} = "<30" \mid \text{buys} = \text{"no"}) = 3/5 = 0.6$$

$$P(\text{income} = \text{"medium"} \mid \text{buys} = \text{"yes"}) = 4/9 = 0.444$$

$$P(\text{income} = \text{"medium"} \mid \text{buys} = \text{"no"}) = 2/5 = 0.4$$

$$P(\text{student} = \text{"yes"} \mid \text{buys} = \text{"yes"}) = 6/9 = 0.667$$

$$P(\text{student} = \text{"yes"} \mid \text{buys} = \text{"no"}) = 1/5 = 0.2$$

$$P(\text{credit_rating} = \text{"fair"} \mid \text{buys} = \text{"yes"}) = 6/9 = 0.667$$

$$P(\text{credit_rating} = \text{"fair"} \mid \text{buys} = \text{"no"}) = 2/5 = 0.4$$

Age	Income	Student	Credit_rating	Buys_computer
<=30	high	no	fair	no
<=30	high	no	excellent	no
30...40	high	no	fair	yes
>40	medium	no	fair	yes
>40	low	yes	fair	yes
>40	low	yes	excellent	no
31...40	low	yes	excellent	yes
<=30	medium	no	fair	no
<=30	low	yes	fair	yes
>40	medium	yes	fair	yes
<=30	medium	yes	excellent	yes
31...40	medium	no	excellent	yes
31...40	high	yes	fair	yes
>40	medium	no	excellent	no

➤ 然后，计算总的条件概率和先验概率：

$$P(X \mid \text{buys} = \text{"yes"}) = 0.222 \times 0.444 \times 0.667 \times 0.667 = 0.044$$

$$P(X \mid \text{buys} = \text{"no"}) = 0.6 \times 0.4 \times 0.2 \times 0.4 = 0.019$$

$$P(\text{buys} = \text{"yes"}) = 0.643, P(\text{buys} = \text{"no"}) = 0.357$$

➤ 最终，计算该用户购买电脑的概率：

$$P(\text{buys} = \text{"yes"} \mid X) = \frac{0.044 \times 0.643}{0.044 \times 0.643 + 0.019 \times 0.357} = 80.7\%$$

手写数字识别

➤ 输入 X : 图片的像素值

➤ 输出 Y : 0-9共10个类别

手写数字识别

➤ 问题的简化与假设:

- 假设图片压缩为16*16的网格
- 每个格子仅有两个取值，即1（黑色）和0（白色）
- 每个格子相互独立
- 输入被转换为一个特征的向量

➔ $X = \langle X_{0,0} = 1, X_{0,1} = 0, X_{0,2} = 1, \dots, X_{15,15} = 0 \rangle$

- 虽然图片特征维度高，仍可建模为朴素贝叶斯分类模型

$$P(Y, X_{0,0}, \dots, X_{15,15}) = P(Y) \prod_{i,j} P(X_{i,j}|Y)$$

手写数字识别

$$P(Y, X) = P(Y) \prod_{i,j} P(X_{i,j} | Y)$$

$P(Y)$

1	0.1
2	0.1
3	0.1
4	0.1
5	0.1
6	0.1
7	0.1
8	0.1
9	0.1
0	0.1

$P(X_{3,1} = 1 | Y)$

1	0.01
2	0.05
3	0.05
4	0.30
5	0.80
6	0.90
7	0.05
8	0.60
9	0.50
0	0.80

$P(X_{5,5} = 1 | Y)$

1	0.05
2	0.01
3	0.90
4	0.80
5	0.90
6	0.90
7	0.25
8	0.85
9	0.60
0	0.80

手写数字识别

➤朴素贝叶斯分类（为简洁，这里仅列出了2和3两类）

$$P(Y = 2) = 0.1$$

$$P(X = 1|Y = 2) = 0.8$$

$$P(X = 1|Y = 2) = 0.1$$

$$P(X = 0|Y = 2) = 0.1$$

$$P(X = 1|Y = 2) = 0.01$$

$$P(X, Y = 2) = 8 * 10^{-6}$$

$$P(Y = 3) = 0.1$$

$$P(X = 1|Y = 3) = 0.8$$

$$P(X = 1|Y = 3) = 0.9$$

$$P(X = 0|Y = 3) = 0.7$$

$$P(X = 1|Y = 3) = 0.0$$

$$P(X, Y = 3) = 0$$

分类结果为2!

手写数字识别

➤使用平滑过后的普通朴素贝叶斯分类:

$$P(Y = 2) = 0.1$$

$$P(X = 1|Y = 2) = 0.79$$

$$P(X = 1|Y = 2) = 0.11$$

$$P(X = 0|Y = 2) = 0.11$$

$$P(X = 1|Y = 2) = 0.02$$

$$P(Y = 3) = 0.1$$

$$P(X = 1|Y = 3) = 0.79$$

$$P(X = 1|Y = 3) = 0.89$$

$$P(X = 0|Y = 3) = 0.70$$

$$P(X = 1|Y = 3) = 0.01$$

$$P(X, Y = 2) = 1.9 * 10^{-5}$$

分类结果为3

$$P(X, Y = 2) = 4.9 * 10^{-4}$$

朴素贝叶斯分类

➤ 优势：

- 易于实现
- 一定可解释性
- 适合于类别型特征
- 计算效率高

➤ 缺点：

- 假定不同特征的影响是独立的
 - 现实中很多场景，特征影响是互相影响的
 - 例如，图片分类中，不同像素间有联系
 - 例如，疾病诊断中，是否发烧、是否咳嗽、血常规等
